Vegan Restaurant
Technical Requirements

About

The Consultant firm we are working got a contract for a new vegan restaurant opening in the hottest location in our city. The restaurant is backed up by important investors, meaning that if the restaurant is well received, it will expand to multiple franchises in Sweden and in the nordic region. So we need that this initial website to be a success, in order to secure future contracts for the franchises, technical support, custom CRM and more!

Is your job to develop this initial project with the highest quality standard that our traditional enterprise customers are used to, even if is a small website for a restaurant that is opening with just 1 location and a few menu items.

The the restaurant owner consulted with its sibling and it said to request the site to build with a *"web technology that is commercial in case you need to expand the project on your own"*. This is translated to utilize React instead of other web frameworks.

Note: The name and branding is being researched by a group of external consultants, so please use any name, color and logo.

Technical requirements

The website must have multiple pages instead of being a single landing page. The client requested that instead of a traditional "food menu" where you can see the product categories, each category is a direct link from the navigation.

Thus, the website will have:
1. Home page
2. Dishes (salads, soups, etc)
3. Deserts
4. Drinks
5. Contact

Home page

The home page will have a hero with a nice picture with the name of the restaurant and a slogan in the middle.

If also will quickly describe what make its dishes uniques, same with the deserts and drinks.

Finally a footer must be present in this page and all other pages.

Categories: Dishes, Desserts, and Drinks
Each of this pages, must show the products (add at least 4 and maximum 8 products per category)

Each product must have: picture, title and a very short description (no more than 1 sentence)

When clicking each product, it should navigate to another page showing the product in detail. Note this must be a navigation to another page instead of a modal.

Product
The product page is used to explain in detail each dish, desert and drinks. They showcase a high resolution picture of the product, a longer and detailed description, a list of ingredients (at least 5) and a table with nutrition facts.

It also contains a button to go back to the category page you where before clicking this product.

Contact page
The contact page showcase a high quality picture of the owner, the opening times, a contact form so anyone can book tables, the address, and a map embedded inside the page.

Extra requirements
Make the contact form in the contact section real using any method you choose.

Use icons for each ingredient (example 🥕 for carrot, 🍅 for tomato, etc)

The map is a real map instead of a screenshot.

Wisdom tips & Anti-requirements
Vegan is not the same as vegetarian, research before adding the wrong menu items.

The site must be mobile first, is up to you to reverse engineer the low fidelity mockup into a mobile version before coding.

Just browse a nutrition facts table and write different values per product. Same with the ingredient list.

Do not use a modal for viewing the individual products, send the user to a new page.

Deliverables

You will use the project spreadsheet that has space for 7 links. Each one for each step of the 7 step process. I will not grade a project that as any of the steps missing and will remove points if the steps differs too much from the final project.
